

hERG: data-extracted constants and tables, tested by held-out forward prediction

a hERG $I = G \cdot m \cdot h \cdot (V - E_{rev})$

$E_{rev} = -88.33$ mV (single value, all protocols & cells)

every voltage dependence = measured lookup table
(log-linear interpolation, endpoint clamp)

no rate equations · no topology · zero tuning

per-cell free parameters: G only
