

Drug grammar: drugs edit steady-state occupancy tables, not time constants

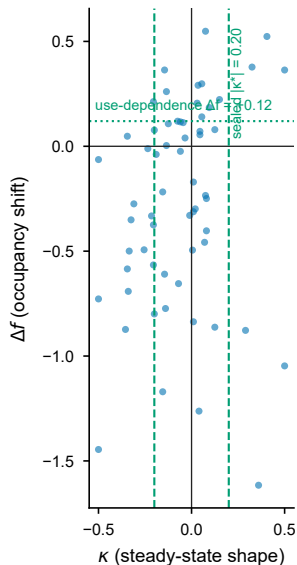

a

hERG
single amplitude component
($|\kappa^* - 1| = 0.020$; warp $\approx 15\%$)

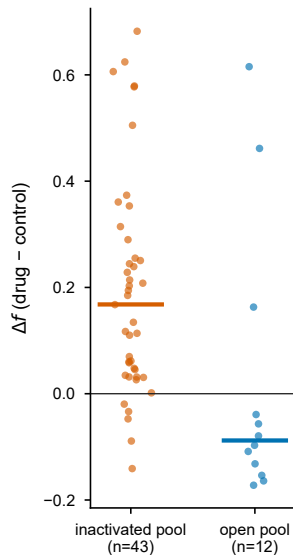

b

Nav1.5
dual component: amplitude + temporal
($|\kappa^*| = 0.20$; use-dependence $\Delta f = +0.12$)

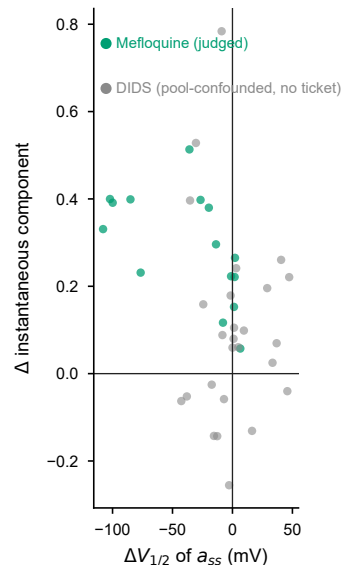

c

CaV1.2
pools move in opposite directions
(+0.168 / -0.088)

d

IKs
multi-table modulation
(a_{ss} shift + inst +0.30 + deact. suppression)

Common grammar: drugs move steady-state occupancy / inactivation tables, not time-constant tables. Pure conductance block rejected in all four channels.
